

AFPAK Delivers K Cup Filling Machines to Various Countries

AFPAK now caters to orders from different parts of the world.

Wenzhou, Jan 29, 2019 (Issuewire.com) - AFPAK, a manufacturer of coffee packaging solutions, was able to install their [K Cup Filling Machine](#) in a US-based factory. Their first time to deliver to the country was back in November of 2017. For the company, it was a memorable experience. The project started sometime in May. It took them two months to build the machine. It will take this long to make their machines as they make sure that each step of the production process goes the way they want it.

"It usually takes us about two months to finish building the machines. We have to get our materials from high-end companies that guarantee quality and stability. We also perform quality control by checking all the specifications and testing the machines if they work properly." One of AFPAK's engineers shared regarding their manufacturing process.

After the production process, the machine will be shipped to the client's factory, which will take two months when delivered to the US. When the machine arrives, it will take three months to prepare it in the client's factory. The installation process will take three days.

AFPAK shared that the all-in-one solution they provided to their first US client included the AF-H2 K Cup Filling Sealing Machine, air compressor, nitrogen generator, and empty k cups and sealing foil. Once the machine arrives along with the added features, the client can right away start production after the installation is completed.

According to the company, it was truly memorable because there was no need to send their engineers to the US to assist the client in operating the machine.

"We didn't have to go there to assist our client with the machine. All we did was send them a step-by-step guide video and we also communicated through a video call. It was really amazing because it was our first US customer. It was a new experience not only for us but for our client as well." an AFPAK engineer shares as he recalls the experience.

They also think that they were very lucky at that time. Their client was easy to communicate with and it only took him three days to understand the process and operate the machines properly.

Their client was happy with the machine he received and business has improved significantly, thanks to his AF-H2 K Cup Filling Sealing Machine.

About AFPAK

AFPAK is a team of skillful engineers and personnel that aims to provide their customers top-quality coffee packaging machines at a reasonable price. With more than eight years of experience, the company was able to create and design different types of packaging machines for various kinds of coffee capsules, including the Nespresso, Dolce Gusto, K Cups, and the Lavazza. They make sure that they stay updated and at the top of the industry through their Research and Development team.
