

Titanium Elastic Nailing System for Diaphyseal Fractures

Diaphyseal Fractures need extra care and rigid fixations.

Delhi, New Delhi, Apr 24, 2021 (Issuewire.com) - Titanium Elastic Nailing System is used for fixing diaphyseal fractures of long bones, in those cases where the medullary canal is relatively narrow, or the flexibility of the implant is superior to all others. These fractures occur in double bones, hence, they are also called double bone fractures.

The Titanium Elastic Nailing System helps to fix the long bone fractures which are either caused by road

accidents or by road mishaps. As this orthopedical implant is made up of Titanium, hence it remains bio-compatible with the body along with providing essential support for the bones to heal properly.
