

Make Your Own Water From The Air With Akvo H2O's Ground-Breaking Technology

Casper, Wyoming Dec 31, 2021 ([IssueWire.com](https://www.issuewire.com)) - Water is quickly becoming extremely scarce due to various reasons like Climate change, water pollution, waste of water, and more. Humans can't live without it and companies are taking advantage of it by making it the biggest commodity on Earth. Akvo H2O is here to break the monopoly created by these companies and de-commodify water with their simple yet highly-advanced technology. The company is bringing clean and mineral-rich water to people with their remarkable Akvo Pods. The device is designed to generate water directly from the air without the need for any traditional source of water.

The natural sources of water are dying out quickly and the world has failed to come up with a sustainable solution. Akvo H2O has put their years of experience, research, and latest technology to use to create water from thin air. The Akvo Pods only need atmospheric water vapor to make drinking water. They can make up to 50 liters of water every single day at conditions of 30°C and 80% relative humidity.

The pods can function properly in temperatures between 15°C and 55°C. It also needs relative humidity of 30 to 99% so it can extract the water vapors from the air to create water. They need nominal power consumption, only 0.65KW at 30°C, and 80% relative humidity to work. They have a highly developed filtration system that cleans the water in a way that other filtration devices can't. The pods generate pure and mineral-rich water without any harmful chemicals, pesticides, bacteria, or viruses. The users will no longer have to rely on water lines from the municipal water supplies and pay hefty bills for it.

Akvo H2O is a USA-based company that has come up with an innovative technology that allows users to create water out of thin air and filter it for drinking. Their Akvo Pods are a revolutionary product that can not only save users a lot of money but solve the water crisis on a global scale. They are also bringing the world's first water blockchain tokens which will be available from 2022. For more details,
