

Change Your Filters Regularly to Prolong Your HVAC System Lifespan With United Filter Company

United Filter Company talks about the best furnace filters to improve the overall lifespan of your HVAC system.

Mississauga, Ontario Jan 24, 2023 (IssueWire.com) - A furnace filter eliminates impurities from the air before it is conditioned. Furnace filters are commonly installed in buildings with heating, ventilation, and air conditioning (HVAC) systems, and people spend money on changing them at least once a year.

United Filter has a wide range of 5" furnace filters effective at controlling dust, dust mites, pollen, and pet dander. They are suitable for installation in most residential, commercial, and industrial buildings.

According to public health experts, installing the correct size and type of filter for each system can significantly improve indoor air quality, aiding in the filtration of airborne viruses. United Filter, in its range of heating, ventilation, and air conditioning (HVAC) filters, comprises higher-rated filtration panels in several new sizes, including the 16x25x5 furnace filter, MERV 11 furnace filters, and [Carrier M1-1056 furnace filter](#).

A furnace filter tends to get dirty when it works to trap airborne particles and contaminants. If neglected, it blocks airflow. Consequently, the filter has to work harder to pull air through, increasing wear and tear and energy costs. The company advises changing filters regularly not only to enjoy clean and fresh air indoors but also to prolong the HVAC system's lifespan.

“The air quality in your house can contain harmful particles if the air is not filtered effectively. This is dangerous for your health”, a United Filter spokesperson shared. “Always purchase the right filter from the various options available online because a filter of an incorrect type or size can damage your appliance, leading to the need for an expensive repair.”

With a 5-inch furnace filter, you get cleaner air and better performance so that the indoor air quality is not contaminated with harmful particles that impact your health and overall well-being.

A 16x25x5 MERV 11 [furnace filter](#) blocks fine particles of 3 microns and smaller. These tiny particles include dust, pollen, dust mites, bacteria, cigarette smoke, pet dander, and smog. A MERV 8 filter is the right choice if you need a more affordable air filter, while you need the MERV 13 filter to attack mold spores, germs, and wood-burning fireplaces.

United Filter is a Mississauga, Ontario, manufacturer, and distributor of filters for heating, ventilation, and air conditioning (HVAC) systems, delivering the products to Canada and the USA. The product portfolio comprises 1", 2", 3", 4", and 5" furnace filters in various sizes, packs, and MERV ratings.
