Chiropractic is a form of alternative medicine that mainly deals with the diagnosis and treatment of biomechanical disorders of the musculoskeletal system, especially the spine. These disorders can also cause negative effects on the neurological system of the body, as well. A chiropractor uses spinal manipulation and other techniques to manage patients' health concerns, including neck pain, back pain, headaches, vertigo, and a long list of other ailments and conditions. They aim to improve patients' physical functionality and quality of life by properly aligning the body's musculoskeletal structure and enabling the body to heal itself naturally, without the use of medication or surgery.
