How Does ChillWell Work?

ChillWell works using the power of evaporative cooling. It uses a fan and water tank to absorb heat from the air, allowing the device to constantly cool down the air.

Each ChillWell has four fan speeds, including low, medium, high, and turbo cooling modes. You may want to use the low setting at night and the turbo setting for hot afternoons.

The secret to ChillWell's cooling is the use of a water tank. You pour water into the water tank. Then, the fan blows hot air over this water tank, creating evaporation. The hot air causes the water in the tank to evaporate. Evaporation is a reaction requiring heat. That heat then gets transferred to water in the tank, allowing the air to cool.

ChillWell Ac also has additional cooling cartridges to add even more coolness to the air. After removing heat from the air with the power of evaporation, ChillWell Ac passes that air over cooling cartridges to help you stay comfortable.
