

Top Miami Dentist Announces Cutting-Edge Dental Technology for Enhanced Patient Care and Comfort

Dr. Bruno Sharp has been a dentist in Miami for more than four decades. He has worked in dentistry long enough to witness several technological advancements

than four decades. He has worked in dentistry long enough to witness several technological advancements. When new tools and equipment can improve the quality of care his team provides for our patients at Sharp Dentistry & Associates.

Here are a few examples of how we apply cutting-edge tools and techniques:

Put Your Relaxation First: You may remember how unpleasant it was to get an injection on the roof of your mouth (the palatal area) before dental surgery. Thanks to a piece of technology known as the Wand®, patients may endure these injections with minimal discomfort. What more could you want in a recommendation than that? The Wand® was the clear winner in our research, so we upgraded to the newest technology, and now our patients can relax during injections since they know it will be quick and painless. A significant improvement in patient comfort is achieved by using a buffer to lessen the "sting" of the anesthetic injection. We try our best to calm patients' nerves before the infusion, as this is the point of most patients' visits that causes the most stress.

Keep It Simple and Precise: No one enjoys the experience of having to press their teeth into a tray of sticky imprint material. In the past, getting tooth impressions was a necessary but annoying part of getting braces. When helping patients straighten their teeth with Invisalign®, an accurate model of their teeth is essential. Our company bought numerous iTero® scanners to replace the need for traditional imprint materials. By taking a precise digital image of a patient's teeth, this scanner can eliminate the need for conventional impressions. In addition, iTero may show patients what their final smile will look like when Invisalign® treatment is complete during the consultation.

Greater Use of Technology to Improve Medical Services: We recognize the need to invest in cutting-edge equipment for the benefit of our patients and are prepared to do so. Our oral surgeons and periodontists can insert implants with more precision and accuracy because of the use of state-of-the-art CT scanners and lasers, both of which allow for earlier detection of cavities. Our [Miami Dentist](#) is equipped with cutting-edge tools because we're serious about giving our patients the finest care possible.

Dentists nowadays can only help their patients get the smiles they want with cutting-edge technology. Is your dentist up to date on the newest tools for optimal care? Contact Sharp Dentistry & Associates if you need a dentist. It would be our pleasure to offer you the same high standard of care we've given hundreds of satisfied clients in Miami over the years. Don't hesitate to call [Dentist in Miami](#) and schedule an appointment right now.
