

breacher.ai launches cybersecurity service to test and educate users for emerging AI threats

C-suite voice cloning is a rising threat for cybersecurity teams and users. breacher.ai launches industry first service to test and educate users against emerging AI threats.

Sunnyvale, California Dec 11, 2023 ([Issuewire.com](https://www.issuewire.com)) - breacher.ai launches cybersecurity service to test users against the emerging threat of voice cloning using AI. Voice cloning of C-suite executives is a rising threat to businesses of all sizes. Bad actors and cybercriminals are using AI to manipulate the audio of C-suite and then target users to trick them into performing an action through social engineering. Audio cloning makes any person susceptible to having their voice impersonated and used in a distributed attack against employees and users. breacher.ai simulates these types of attacks using AI-cloned audio and tests employees and a user base against audio attacks for susceptibility.

Additionally, breacher.ai incorporates and blends in user awareness training to thwart these types of attacks and educate users. Users who fail the simulation are automatically sent educational material for security awareness.

The benefits of this approach are testing and educating users against susceptibility to social engineering attacks using AI. Perimeter testing to determine the efficacy of security tools and solutions for detection. Penetration measurement to determine how vulnerable your company is to AI-powered social engineering attacks.

breacher.ai is able to custom-craft simulations and tailor them to individual business needs. Attack simulations focus on emerging threats so your employees are ahead of the curve.

Traditional phishing simulations only focus on email and do not fully address the gap in security from advanced phishing techniques used by bad actors such as vishing. With the rise of deepfakes, it's becoming easier for cyber criminals to quickly impersonate senior executives, and then use them to attack employees. Humans are the most susceptible to social engineering attacks, which is expected to rise drastically in the next few years.

Traditional security tools are not able to stop these types of attacks. The only solution is testing and user awareness.
