

Non-Newtonian Propulsion Indicates Rockets Not Being Able to Colonize Mars or Moon

Roma, Lazio Nov 21, 2024 (IssueWire.com) - Advanced technology and a continuous effort have made quite a few unthinkable things possible. One of the things that has seen rapid growth with the help of technology and efforts from scientists is space exploration. However, the dream of colonizing Mars or the Moon seems to be not fulfilling and a major part of the reason is rockets. Building a solution for this, the Association for Space Propulsion Development (ASPS) has come up with the ALIEN ASPS PNN prototype. The company is not against agencies like NASA, ESA, and Elon Musk's SpaceX, but, the list of facts proves why rockets can never achieve what this prototype can.

I E. Laureti has already been banned from X, and NSF (NasaSpaceFlight) because of the stances against rocketry. The first reason is that more than 55 years after the glorious Apollo 11 feat, the rocket astronautics could only colonize a space station. The Space Shuttle has been abandoned as it wears out like all rockets where the principle of disposable exists. So, apart from the ever-increasing costs, the goal should be to increase efficiency and Musk's promises are far from real.

ASPS also points out only 0.3% of Artemis returned to Earth on a trip around the moon. This is almost identical to the return to Earth of Apollo 11, meaning that only minerals will be imported from the Moon in homeopathic quantities. The ASPS-developed PNN does not violate Newton's principles. Commonly, the principle of action and reaction can violate electrodynamics. It is also experimentally explained how Non-Newtonian Propulsion (PNN) works and anyone in doubt can visit and see the tests for themselves. For this, a new long-term test (1 hour) has been added to the new ALIENA. The prototype demonstrates that it can take off with a further prolonged thrust. The president of ASPS, E. Laureti, claims that a spaceship that does not lose its pieces like rockets can be built there, finally colonizing the Moon and Mars.
