SPINE PROCEDURE

Tampa, Florida Jan 8, 2025 (Issuewire.com) - Florida Surgery Consultants, a leader in advanced surgical and interventional pain management, is proud to announce its role as a provider of the groundbreaking [DISCSEEL® Procedure](#). This minimally invasive treatment addresses chronic back and neck pain caused by torn and damaged spinal discs. By offering the DISCSEEL Procedure, Florida

Surgery Consultants reinforces its commitment to delivering state-of-the-art solutions that enhance patient outcomes and restore quality of life.

Chronic pain related to spinal disc conditions is a significant challenge for many individuals, often limiting mobility and impacting daily activities. Florida Surgery Consultants recognizes the need for effective, minimally invasive options and aims to meet this demand with the [DISCSEEL Procedure](#), a treatment supported by placebo-controlled studies and an **82% success rate**.

Millions of Americans suffer from chronic back and neck pain caused by degenerative disc disease, herniated discs, sciatica, and other spinal conditions. Traditional surgical interventions, such as spinal fusion, often fail to address the root cause of these issues—torn or leaking spinal discs—and can result in high rates of failure and additional surgeries.

Annular tears in spinal discs allow the gel-like nucleus pulposus to leak, inflaming surrounding nerves and causing persistent pain. **Leaky Disc Syndrome**, as coined by **Dr. Kevin Pauza**, inventor of the DISCSEEL Procedure, highlights this critical yet underdiagnosed issue. Without effective intervention, these conditions can worsen over time, leaving patients with few viable options for relief.

“At Florida Surgery Consultants, we are committed to providing our patients with innovative, evidence-based solutions for chronic pain,” said **Lyn Nixon**, CEO of Florida Surgery Consultants. *“The DISCSEEL Procedure aligns perfectly with our mission to deliver minimally invasive treatments that not only alleviate pain but also address the underlying cause of spinal disc damage. We are proud to offer this groundbreaking procedure to our patients, empowering them to regain their mobility and improve their quality of life.”*

The DISCSEEL Procedure is the first minimally invasive treatment specifically designed to seal and heal torn spinal discs. Using **fibrin**, an **FDA-approved biologic** for certain wound-healing applications, the procedure seals damaged discs to stop leakage and reduce inflammation in spinal nerves. Over time, fibrin promotes the growth of healthy new disc tissue, offering long-term relief from chronic pain.

Performed as an **outpatient procedure**, the DISCSEEL Procedure begins with an **Annulogram**, a pain-free diagnostic test that identifies subtle disc tears often missed by MRIs or discographies. Following this, fibrin is precisely injected under fluoroscopic guidance into the damaged discs, immediately sealing tears and stimulating tissue regrowth over the course of **three to twelve months**.

This cutting-edge approach eliminates the need for invasive surgeries like spinal fusions, which are known for high failure rates and adjacent segment degeneration. Patients treated with the DISCSEEL Procedure frequently report significant improvements in pain and mobility, including those who have previously undergone failed back surgeries or regenerative treatments such as stem cell therapy.

By introducing the [DISCSEEL Procedure in Florida](#), Florida Surgery Consultants is addressing the unmet needs of patients in Florida and setting a benchmark for innovative spinal care nationwide. The procedure has already demonstrated success, enabling patients to resume daily activities and reduce their reliance on opioid medications.

For Florida communities, the availability of this treatment means access to effective care close to home. Beyond local benefits, the DISCSEEL Procedure represents a shift in how chronic spinal conditions are treated, offering hope to patients who have struggled to find relief.
